joint work with M. Bravin (Cantabria), M. Gnann (Delft) , N. Masmoudi (NYUAD), F. Rodenburg (Delft), J. Sauer (Jena)

We consider the evolution of a two-dimensional liquid droplet on a solid substrate in the presence of a contact point. At the liquid-solid interface we assume Navier slip. At the triple point we assume a constant contact angle, given by Young's law. The main result is well-posedness and regularity of the solution in a class of weighted Sobolev spaces.
